

Peer Feedback Log

Issue 1: No securityContext on kk-payments Deployment (High, Resolved) #10

- **Severity:** High
- **Description:** The Deployment in k8s/base/deployment.yml had no securityContext at either the pod or container level. Containers ran as root by default with full Linux capabilities, violating Kubernetes baseline pod security standards.
- **Resolution:** Added pod-level securityContext (runAsNonRoot, runAsUser 1000, fsGroup 1000) and container-level securityContext (allowPrivilegeEscalation false, capabilities drop ALL).
- **Committed:** Yes. fix(k8s): add securityContext to Deployment (#10)

Issue 2: No PodDisruptionBudget for kk-payments (High, Resolved) #11

- **Severity:** High
- **Description:** The Deployment specifies replicas: 3 for a critical payments service, but no PodDisruptionBudget existed. During voluntary disruptions such as node drains or cluster upgrades, all 3 replicas could be evicted simultaneously, causing downtime.
- **Resolution:** Created a PodDisruptionBudget (pdb.yml) with minAvailable: 2, ensuring at least 2 replicas remain available during voluntary disruptions. Added the PDB to the base kustomization resources.
- **Committed:** Yes. fix(k8s): add PodDisruptionBudget for kk-payments (#11)

Issue 3: capstone-scope.md tracked despite .gitignore rule (Low, Resolved) #12

- **Severity:** Low
- **Description:** The file capstone-scope.md is listed in .gitignore (line 71) but remained tracked in git because it was committed before the ignore rule was added. Git does not automatically untrack files that are already committed, so the .gitignore rule had no effect.
- **Resolution:** Ran git rm --cached to stop tracking the file without deleting it from the working directory. The .gitignore rule now takes effect.
- **Committed:** Yes. fix: untrack capstone-scope.md from git (#12)
